Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First-order Weather Bureau Station; precipitation is for the 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation is measured in the morning; amount then recorded is for the preceding 24 hours. ‡ Precipitation measured with recording gage. * Included in the next measurement.

T. Trace, or precipitation less than .01 inch. † Post Office addresses as follows: Aberdeen, Buckhannon; Benson, Miletus; Brownsville, Weston; Dailey, Beverly; Dam 10, Morgantown; Dam 13, McMechen; Dam 15, Hoult; Dam 19, Washington; Dam 20, Belleville; Elk, West Milford; Greenbottom, LeSage; Hackers Creek, Jane Lew; Jackson's Mill, Weston; Kanawha Falls, Glen Ferris; Knobly Mountain, Keyser; London Locks, London; Midvale, Ellamore; Rockford, Lost Creek; Seneca State Forest, Clover Lick; Spruce Knob, Circleville; Stony River Dam, Maysville; Terra Alta, Hopemont; Vandalia, Roanoke; Winfield Locks, Red House.

VOL. XLVII PARKERSBURG, W. VA., OCTOBER 1939 No. 10

GENERAL SUMMARY

For the State as a whole, precipitation was slightly above normal. The northeastern panhandle division averaged 130 per cent and the northern division 112 per cent of the normal. Except for one station all the stations reporting an excess were in the northeastern panhandle and northern divisions. However, the southern division continued considerably below normal, averaging only 75 per cent of the normal in October and only 58 per cent in the three months ending October 31st. In consequence, a forest fire hazard developed early in the month in the southern division. This situation became acute by the 23d with 32 new fires breaking out in the counties of McDowell, Mercer, Wyoming, Mingo, Kanawha, Boone, Nicholas, Raleigh, Logan, and Lincoln. These fires were brought under control with the help of the showers of the 26th and succeeding days. Measurable amounts of snow fell in Pocahontas, Randolph, Pendleton, Tucker, and Grant Counties on the 31st, necessitating the use of snow plows on Route 219 in Tucker County.

Temperatures averaged 1.3° above normal. The latter part of the first decade was unseasonably warm with five stations reporting maximum temperature of 92°. Killing frosts were reported from a large number of stations on the 13th and 15th.

Sunshine and clear skies were somewhat above normal. Visibility was lessened on a considerable number of days by ground fogs and local and forest fire smoke.

The weather favored farm work, much of the corn crop being shucked and cribbed. Winter grains were benefited by the rains at the end of the month and are off to about a fair start. Grasses deteriorated most of the month to be somewhat revived by the rains at the end. Farm water supply in southern half of the state continued very low.—C. L. W.

TEMPERATURE

The average monthly temperature for the State, based on the records of 61 stations, was 55.9°, or 1.3° above the normal. The mean for the northeastern panhandle division was 53.8°; for the northern division, 55.3°; and for the southern division, 57.3°. The highest monthly mean was 61.6° at Huntington and the lowest, 48.0° at Bayard. The highest temperature was 92° at five stations, two on the 8th and 9th and three on the 9th, and the lowest, 14° at Beckley on the 15th. The greatest daily range was 61° at Petersburg on the 19th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 106 stations, was 3.24 inches, or 0.38 inch above the normal. In the northeastern panhandle division the average was 3.61 inches; in the northern division, 3.87 inches; and in the southern division, 2.08 inches. The greatest monthly precipitation was 5.58 inches at Martinsburg and the least 0.85 inch at Kanawha Falls. The greatest amount in any 24 consecutive hours was 2.92 inches at Harpers Ferry on the 3d. The average monthly snowfall was 0.1 inch, or 0.2 inch below the normal. The greatest monthly snowfall was 3.00 inches at Stony River Dam. The average number of days with .01 inch or more of precipitation was 8.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for October 1939

VOL. XLVII PARKERSBURG, W. VA., NOVEMBER 1939 No. 11

GENERAL SUMMARY

This was the third driest November of record. Droughty conditions continued unrelieved in the southern division and extended into the northern division during the month. Precipitation averaged only 35 per cent of normal for the State as a whole; the northeastern panhandle division averaged 85 per cent, the northern division 27 per cent, and the southern division 31 per cent of the normal. In the four month period, August through November, the average precipitation for the southern division was only 53 per cent of the normal. Forest fires to the number of 82 were reported on the 16th. This number increased to 109 known fires on the 19th. Showers and high humidity on the 20th and succeeding days helped bring the fires under control. Snowfall on the 5th and 6th covered the northeastern panhandle division to a depth ranging from two to eight inches, and on the 20th-22d snows ranging up to six inches in depth fell in Greenbrier, Monroe, Grant and Mineral Counties.

Temperatures averaged somewhat below normal, although no unusual extremes of cold occurred in the State. The first nine days at most stations saw temperatures considerably below normal. The 10th and the period from the 14th to the 21st were generally considerably above normal, while the period from the 22d to the end of the month was characterized by nearly normal temperatures. The monthly minima occurred generally on the 27th or 29th.

Winter grains were showing some growth, although more moisture was needed. Grasses deteriorated most of the month, except in the northeastern panhandle. Farm water supply continued very low throughout the month.—C. L. W.

TEMPERATURE

The average monthly temperature for the State, based on the records of 61 stations, was 40.8°, or 2.4° below the normal. The mean for the northeastern panhandle division was 41.0°; for the northern division, 40.4°; and for the southern division, 41.3°. The highest monthly mean was 45.1° at Huntington and the lowest, 35.0° at Bayard. The highest temperature was 80° at Institute on the 10th and Grafton on the 11th and the lowest, 10° at Seneca State Forest on the 27th and 29th and at McNeill on the 27th. The greatest daily range was 60° at Brownsville on the 13th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 110 stations, was 0.96 inch, or 1.77 inches below the normal. In the northeastern panhandle division the average was 1.81 inches; in the northern division, 0.80 inch; and in the southern division, 0.84 inch. The greatest monthly precipitation was 3.18 inches at Knobly Mountain, and the least 0.38 inch at Brownsville. The greatest amount in any 24 consecutive hours was 1.59 inches at Knobly Mountain on the 28th. The average monthly snowfall was 2.2 inches, or 0.2 inch below normal. The greatest monthly snowfall was 19.0 inches at Knobly Mountain and Wardensville. The average number of days with .01 inch or more of precipitation was 6.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

VOL. XLVII PARKERSBURG, W. VA., DECEMBER 1939 No. 12

GENERAL SUMMARY

December averaged two degrees above normal in temperature. Only three stations, Beckley, Charleston and Gary were below normal. There were cold spells on the 14-15th and 23d-31st and warm periods on the 6-10th and 16-20th. Only one station reported a minimum temperature of zero or lower, and the State minimum of −4° was the highest since 1931. Thirteen stations reported a maximum of 70° or more.

The precipitation was well distributed, although an average deficiency of 0.83 inch occurred. About 30 per cent of the precipitation fell as snow. All main highways were passable throughout the month, although icy pavements hampered traffic somewhat on the 3d-4th and again on the 20th-21st. Thunderstorms were reported on the 2d, 3d, 10th and 11th from stations in scattered sections of the State. Sleet was recorded on the 2d, 3d, 4th, 5th, 27th, and 29th at widely separated stations.

Farm water supply increased somewhat, but it was still low at the close of the month in central and southern counties. Grain was generally protected by snow cover during the cold spells.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 36.6°, or 2.0° above the normal. The mean for the northeastern panhandle division was 36.1°; for the northern division, 36.2°; and for the southern division, 37.2°. The highest monthly mean was 41.1° at Huntington and the lowest, 31.0° at Bayard. The highest temperature was 75° at Logan on the 7th and the lowest, −4° at Seneca State Forest on the 31st. The greatest daily range was 53° at McNeill on the 7th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 104 stations, was 2.46 inches, or 0.83 inch below the normal. In the northeastern panhandle division the average was 1.68 inches; in the northern division, 2.75 inches; and in the southern division, 2.35 inches. The greatest monthly precipitation was 4.74 inches at Pickens No. 2, and the least, 0.66 inch at Petersburg. The greatest amount in any 24 consecutive hours was 1.29 inches at Pickens on the 20th. The average monthly snowfall was 7.0 inches, or 0.7 inch above the normal. The greatest monthly snowfall was 24.0 inches at Kumbrabow State Forest. The average number of days with .01 inch or more of precipitation was 11.

ERRATA

November 1939: Page 41, under "Precipitation": greatest monthly precipitation should read 3.09 inches at Harpers Ferry; greatest amount in 24 hours, 1.42 inches at Kearneysville on the 4th; greatest monthly snowfall, delete Knobly Mountain. Page 42: Entry at foot of column of greatest 24 hours precipitation should read 1.42. Page 43: Knobly Mountain: delete entry on 28th; total should read 1.59.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for December 1939

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

Vol. XLVII PARKERSBURG, W. VA., YEAR 1939 No. 13

GENERAL SUMMARY

The average temperature for the State was 54.4°, or 1.4° above normal and 0.1° below the 1938 average. While all seasons averaged above normal in temperature, the departures ranging from +3.4° for Winter to +0.4° for Autumn, each season, except Winter, had one month with a deficiency. The warmest months were June and August, 72.7°, and the coldest month was January, 36.4°. June was also the fourth warmest June of record. The highest annual mean temperature, 59.1°, occurred at Huntington and the lowest, 46.2°, at Bayard. The highest temperature was 103° at Ravenswood on September 10th and the lowest, −7° at Rainelle on January 28th. Subzero weather prevailed on four days in the year and was confined to the mountain region.

Precipitation was practically normal in amount but decidedly variable in distribution both as to time and area. February, April and June were very wet months, while May, August and November were extremely dry. Sixty-one per cent of the year's precipitation fell before July 1st, while ordinarily only fifty-three per cent falls in that period. The southern division was particularly deficient during the period August-December, when only fifty-seven per cent of the normal amount was recorded. This situation caused a sharp and serious decline in the water supply in this division, which was eased somewhat at the close of the year, and a serious forest fire hazard prevailed during October and November, culminating in the burning of over 134,000 acres of woodlands with damage estimated at over $670,000. The greatest annual amount of precipitation was 70.33 inches at Pickens and the least, 28.99 inches at Union. The greatest monthly amount was 13.36 inches at Morgantown in June and the least, 0.11 inch at Pickens No. 2 in August. Days with measurable precipitation averaged 126. Snowfall was about two-thirds of normal. The greatest annual snowfall was 92.5 inches at Pickens, and the least, 5.5 inches at Institute. The growing season averaged 165 days.

VOL. XLVIII PARKERSBURG, W. VA., JANUARY 1940 NO. 1

GENERAL SUMMARY

The month was the coldest January of record. The State average temperature was 20.5°, or 12.1° below normal and 0.2° below the cold January of 1918. Only thirteen stations had higher means than in 1918; the others had means ranging from less than one degree to more than seven degrees below the means of 1918, the most pronounced departures occurring in the mountain regions. The severe cold of the 19th brought death by freezing to a negro near Taplan, Logan County, and brought on an epidemic of frozen plumbing, frozen water mains and stalled automobiles.

Precipitation averaged 1.44 inches or 2.21 inches below normal, making it the second driest January of record. It fell mostly as snow which averaged 14.5 inches or 6.5 inches above the normal and ranged from 5.0 inches at Wellsburg to 46.5 inches at Pickens No. 2. The average number of snow-lying days was 26. The warm period and rains of the 14-15th melted the snow at most of the stations except in the mountains. Snows on succeeding days renewed the snow cover which remained to the close of the month at most stations.

Navigation was suspended on the Ohio due to ice conditions on the 3d, and the river remained closed until the end of the month. The supply of potable water became so low, due to prolonged cold weather retarding the seepage of water into the subsoil, that in widely scattered communities the situation became acute.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 20.5°, or 12.1° below the normal. The mean for the northeastern panhandle division was 20.0°; for the northern division, 19.2°; and for the southern division, 22.2°. The highest monthly mean was 25.8° at Williamson and the lowest, 13.6° at Terra Alta. The highest temperature was 62° at Winfield Locks on the 14th and the lowest, −24° at Benson on the 19th. The greatest daily range was 49° at Seneca State Forest on the 29th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 103 stations, was 1.44 inches, or 2.21 inches below the normal. In the northeastern panhandle division the average was 1.41 inches; in the northern division, 1.42 inches; and in the southern division, 1.48 inches. The greatest monthly precipitation was 2.77 inches at Pickens No. 2 and the least, 0.70 inch at London Locks. The greatest amount in any 24 consecutive hours was 1.25 inches at Marlinton on the 14th. The average monthly snowfall was 14.5 inches, or 6.5 inches above the normal. The greatest monthly snowfall was 46.5 inches at Pickens No. 2. The average number of days with .01 inch or more of precipitation was 12.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for January 1940

VOL. XLVIII PARKERSBURG, W. VA., FEBRUARY 1940 No. 2

GENERAL SUMMARY

February was very nearly normal in temperature. Fourteen stations reported readings of zero or lower at some time during the month. No station in the northeastern panhandle division reported a reading as low as zero. Precipitation averaged somewhat above normal, falling mostly as snow. Light rains and warmer weather caused a breakup of the ice-bound condition in the Ohio River beginning on the 6th in the lower reaches, and succeeded in restoring navigation on the 12th. The ice, while moving out, destroyed the ferry at Longbottom, 25 miles below Parkersburg, and crushed several small boats near Parkersburg. On the 13th and 14th a heavy snow blocked the highways in Ohio, Mason, Wood, Randolph and Monongalia Counties to such an extent that school buses were unable to get through, necessitating the closing of schools in those counties for several days. There were frequent short periods with snow on the ground in the southern counties, while in the northern districts snow covered the ground most of the month. Stony River Dam, Spruce Knob, and Alpena had snow covers every day in the month. The slow melting of the snow favored the retention of water by the soil and was very helpful in increasing soil moisture and farm water supply.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 60 stations, was 33.5°, or 0.1° above the normal. The mean for the northeastern panhandle division was 33.3°; for the northern division, 32.4°; and for the southern division, 34.5°. The highest monthly mean was 37.5° at Brownsville and the lowest, 26.6° at Terra Alta. The highest temperature was 73° at Brownsville on the 12th and the lowest, −6° at Pickens on the 26th. The greatest daily range was 66° at Seneca State Forest on the 8th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 105 stations, was 3.84 inches, or 0.66 inch above the normal. In the northeastern panhandle division the average was 2.47 inches; in the northern division, 4.20 inches; and in the southern division, 3.85 inches. The greatest monthly precipitation was 7.36 inches at Pickens No. 2, and the least, 0.95 inch at Brandywine. The greatest amount in any 24 consecutive hours was 1.62 inches at Dam 15, M. R., on the 14th. The average monthly snowfall was 12.5 inches, or 4.1 inches above normal. The greatest monthly snowfall was 41.5 inches at Pickens No. 2. The average number of days with .01 inch or more of precipitation was 14.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of missing days; for example, a one day, b two days etc. § Also on other dates.

Daily Precipitation for February 1940

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. XLVIII PARKERSBURG, W. VA., MARCH 1940 No. 3

GENERAL SUMMARY

The month was considerably below normal in temperature. All stations in the northeastern panhandle division and all but one in each of the northern and the southern divisions were less than normal in temperature. Readings of zero or below were recorded at one station on the 25th and at three stations on the 26th. The cold periods were from the 11th to the 12th and the 23d to the 26th. A warm period occurred from the 27th to the 31st.

Precipitation, while averaging slightly below normal, was well distributed during the month. Snowfall, except for the higher altitude stations, was generally light. The station with the most snow-lying days was Spruce Knob with 29 days of snow cover.

At the end of the month the rivers were rising. The Little Kanawha river at Glenville reached slightly above flood stage on the 31st. Vegetation made little progress until the close of the month when pastures were greening, and, in the southern portion fruit buds were beginning to swell.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 59 stations, was 38.8°, or 3.7° below the normal. The mean for the northeastern panhandle division was 37.5°; for the northern division, 38.0°; and for the southern division, 40.2°. The highest monthly mean was 44.2° at Huntington and the lowest, 31.8° at Terra Alta. The highest temperature was 79° at Huntington, Institute, Spencer and Wellsburg on the 29th, and Camp P-58 and Williamson on the 31st; and the lowest, −3° at Pickens on the 25-26th. The greatest daily range was 60° at Institute on the 27th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 103 stations, was 3.70 inches, or 0.23 inch below the normal. In the northeastern panhandle division the average was 2.66 inches; in the northern division, 4.20 inches; and in the southern division, 3.35 inches. The greatest monthly precipitation was 6.10 inches at Pickens No. 2 and the least, 1.50 inches at Brandywine and Brushy Run. The greatest amount in any 24 consecutive hours was 2.05 inches at Rockford on the 30th. The average monthly snowfall was 3.4 inches, or 2.4 inches below the normal. The greatest monthly snowfall was 16.0 inches at Pickens No. 2. The average number of days with .01 inch or more of precipitation was 13.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. ‖ Incomplete.

Daily Precipitation for March 1940

VOL. XLVIII PARKERSBURG, W. VA., APRIL 1940 No. 4

THE LIBRARY
UNIV.
JUN

GENERAL SUMMARY

The month was the coldest April since 1928 and the seventh coldest April of record. The cold periods were: 9th to 15th and 19th to 28th; while the warm periods were: 1st to 4th, 16th to 18th, and in the west portion from the 29th to 30th. It was the fourth wettest April of record. Practically all of the precipitation fell during the first two decades. Only six stations, all in the southern division, reported deficiencies in precipitation. Snowfall was about normal and was noted throughout the State.

The weather was unfavorable for vegetation and farm work. The cold rains hindered the planting of normal Spring crops. Seeds that were planted were slow in germinating or else rotted in the ground. Fruit was blooming late.

The Ohio River was near flood stage on the 2d and 3d, due to the rains of the latter part of March. The almost incessant rains of the second decade caused a second and greater rise to above flood stage on the 20th, cresting on the 21st and 22d, with stages 6.5 feet to 11.6 feet above flood stage. The Little Kanawha at Creston and the West Fork at Clarksburg also reached flood stage on the 20th. No severe losses were reported, due to timely warnings and efficient methods of evacuation.

TEMPERATURE

The average monthly temperature for the State, based on the records of 60 stations, was 49.2°, or 2.5° below the normal. The mean for the northeastern panhandle division was 47.3°; for the northern division, 48.6°; and for the southern division, 50.5°. The highest monthly mean was 54.2° at Huntington and the lowest, 41.2° at Bayard. The highest temperature was 86° at Logan on the 3d and the lowest, 10° at Beckley on the 13th and Pickens on the 14th. The greatest daily range was 62° at Seneca State Forest on the 6th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 107 stations, was 5.13 inches, or 1.55 inches above the normal. In the northeastern panhandle division the average was 5.06 inches; in the northern division, 5.62 inches; and in the southern division, 4.29 inches. The greatest monthly precipitation was 8.43 inches at Rowlesburg and the least, 2.98 inches at Kanawha Falls. The greatest amount in any 24 consecutive hours was 2.06 inches at Beckley on the 20th. The average snowfall was 1.9 inches, or 0.1 inch above normal. The greatest monthly snowfall was 13.0 inches at Spruce Knob. The average number of days with .01 or more of precipitation was 14.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates ‖ Incomplete.

Daily Precipitation for April 1940

VOL. XLVIII PARKERSBURG, W. VA., MAY 1940 NO. 5

GENERAL SUMMARY

Except for the western half of the southern division, the State was well above normal in precipitation. The heaviest amounts fell in the north-central part of the State, where the excess ranged from 1.63 inches at Brownsville to as much as 4.61 inches above the normal at Buckhannon. The average snowfall was 0.1 inch, which was the first time since 1929 that the state average snowfall was greater than a trace. Only twice has the state average snowfall exceeded that of this month since records began in 1903.

Temperature was below normal at all stations except a few in the northeastern panhandle division and in the west-central division. Cool and warm periods alternated rapidly, and the nights were generally cool. Much fuel for domestic heating was used. Several stations reported frosts on the 7th, 10th, 11th and 12th. No heavy damage was reported.

The weather was rather unfavorable for vegetation. Wet weather delayed planting, and the crops that were planted found unfavorable conditions for germination on account of the low temperatures. Most crops were from three to four weeks late at the close of the month.

A youth was killed by lightning at St. Marys on the 19th while tying-up a boat to a tree.—C.L.W.

TEMPERATURE

The average monthly temperature for the State, based on the records of 60 stations, was 60.1°, or 1.6° below the normal. The mean for the northeastern panhandle division was 60.2°; for the northern division, 59.8°; and for the southern division, 60.4°. The highest monthly mean was 64.3° at Huntington and the lowest, 53.0° at Bayard. The highest temperature was 95° at Martinsburg on the 14th, Hinton on the 8th and 19th, and Logan on the 19th, and the lowest, 22° at Seneca State Forest on the 12th. The greatest daily range was 56° at Institute on the 6th and Marlinton on the 13th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 109 stations, was 4.93 inches, or 0.96 inch above the normal. In the northeastern panhandle the average was 4.36 inches; in the northern division, 5.81 inches; and in the southern division, 3.60 inches. The greatest monthly precipitation was 9.04 inches at Buckhannon and the least, 1.42 inches at Williamson. The greatest amount in any 24 consecutive hours was 3.14 inches at Dam 13 (Ohio River) on the 24th. The average monthly snowfall was 0.1 inch or 0.1 inch above normal. The greatest monthly snowfall was 2.0 inches at Spruce Knob, Pickens, Pickens No. 2, and Flat Top. The average number of days with .01 inch or more of precipitation was 13.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. |||| Incomplete.

Daily Precipitation for May 1940

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. XLVIII PARKERSBURG, W. VA., JUNE 1940 No. 6

GENERAL SUMMARY

The month was the fourth wettest June of record, having a total of 5.97 inches, which was 0.26 inch below that of last June. However, this year the driest section was the northeastern panhandle division and the wettest the southern division, whereas last June the driest section was the southern division and the wettest the northern division. Locally heavy rains caused the flooding of small streams. On the 9th local flood conditions prevailed on the headwaters of McKim Creek and also French Creek in Pleasants County. Fifty families were driven from their homes at Leslie when torrential rains fell in mid-afternoon of the 12th, flooding the Meadow Creek Valley to a depth of eight feet. At Beeson, on the 14th, a farm boy aged 14 years was killed by lightening. On the 19th, a young mother and her two year old son were drowned in flooded Dingess Creek near Logan. On the same day, two brothers, aged 14 and 16 years, were drowned in the swollen Elk River.

All sections averaged above normal in temperature, except a few places in the west central, the northeastern panhandle, and the extreme southeastern parts of the State. There were no noteworthy extremes of temperature.

The weather was favorable for a heavy growth of vegetation. The rainy weather interfered with cultivation and also was the cause of considerable hay spoilage.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 60 stations, was 70.3°, or 0.6° above the normal. The mean for the northeastern panhandle division was 70.1°; for the northern division, 70.4°; and for the southern division, 70.4°. The highest monthly mean was 75.2° at Huntington and the lowest, 63.8° at Flat Top. The highest temperature was 98° at Institute on the 7th and the lowest, 31° at Alpena on the 22d and 23d and Bayard on the 21st and 22d. The greatest daily range was 49° at White Sulphur Springs on the 3d.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 113 stations, was 5.97 inches, or 1.53 inches above the normal. In the northeastern panhandle division the average was 3.76 inches; in the northern division, 6.24 inches; and in the southern division, 6.50 inches. The greatest monthly precipitation was 10.48 inches at Pickens and the least, 1.28 inches at Kearneysville. The greatest amount in any 24 consecutive hours was 3.50 inches at Benson on the 12th. The average number of days with .01 inch or more of precipitation was 17.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. ‖‖ Incomplete.

Daily Precipitation for June 1940

VOL. XLVIII PARKERSBURG, W. VA., JULY 1940 No. 7

GENERAL SUMMARY

Precipitation was practically normal; at the same time the month was the second driest July since the drought year of 1930. July 1937 averaged only 3.96 inches, while the driest July of record was that of 1930 when the state average was 1.90 inches. The marked deficiencies of precipitation occurred in the Ohio and the Kanawha Valley counties, while notable excesses occurred in the southeastern counties and the northeastern panhandle.

Temperatures averaged slightly below normal. Departures from the normal varied considerably, no division or subdivision, however, being completely above or below the normal. The most prominent deficiencies occurred in Randolph county and the greatest excesses in adjacent Pocahontas county.

Vegetation grew well throughout the month and harvesting of small grains was in progress at the close.

Thunderstorm damage occurred at Charleston at 3 p. m. on the 22d: plate glass windows were smashed; roofs from two downtown buildings were taken off; hundreds of trees were blown down; and 250 telephones were put out of order. Officials reported several thousand dollars worth of damage to power facilities. Minor damage was caused by lightning on the 23d at Elizabeth, on the 24th at Dam 19 in Wood county, on the 25-26th at Elkins, and on the 28th at Martinsburg and Charleston.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 60 stations, was 72.5°, or 0.6° below the normal. The mean for the northeastern panhandle division was 72.5°; for the northern division, 72.2°; and for the southern division, 72.8°. The highest monthly mean was 77.2° at Huntington and the lowest, 65.5° at Pickens. The highest temperature was 103° at Martinsburg on the 26th and the lowest, 33° at Thornwood (Fire Weather Station) on the 4th and Terra Alta on the 14th. The greatest daily range was 50° at McNeill on the 11th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 120 stations, was 4.43 inches, or 0.18 inch below the normal. In the northeastern panhandle division the average was 3.73 inches; in the northern division, 4.41 inches; and in the southern division, 4.75 inches. The greatest monthly precipitation was 8.28 inches at Gary and the least, 0.98 inch at Winfield Locks. The greatest amount in any 24 consecutive hours was 3.51 inches at Mullens on the 18th. The average number of days with .01 inch or more of precipitation was 11.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. |||| Incomplete.

Daily Precipitation for July 1940

VOL. XLVIII PARKERSBURG, W. VA., AUGUST 1940 No. 8

GENERAL SUMMARY

While the temperature was only slightly below normal, the month was the coolest August since 1930. Stations in the northern and a few in the southern division averaged slightly above normal, while elsewhere they were below normal with marked deficiencies in the northeastern panhandle division.

Precipitation was well above normal. The heaviest amounts occurred over the high-level sections of the southeastern counties, with secondary maxima over the northeastern border districts and the Ohio valley region between Wellsburg and Belleville, while the larger areas with precipitation below normal included the southwestern and the north-central counties. Good showers occurred at most stations on the 7th, 18th and 19th, and at southern stations on the 14th. A period of good rains started on the 26th and continued to the end of the month. Heavy rains on the 13-14th resulted in the New River and the Great Kanawha River above Charleston exceeding their flood stages by many feet. Considerable damage resulted: Tow boats and barges broke loose, collided and sank; buildings and crops were inundated or washed away; goods were destroyed or spoiled. The major part of the damage occurred between Hinton and Charleston.

Conditions during the first half of the month were somewhat unfavorable for crop growth in many localities because of insufficient moisture, but were favorable for harvesting. The last week was too wet for farm work.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 63 stations, was 71.4°, or 0.4° below the normal. The mean for the northeastern panhandle division was 69.4°; for the northern division, 71.9°; and for the southern division, 71.8°. The highest monthly mean was 77.2° at Huntington and the lowest, 63.4° at Bayard and Beckley (Fire Weather Station). The highest temperature was 98° at Inwood on the 6th and the lowest, 34° at Beckley (Fire Weather Station) on the 20th and 21st. The greatest daily range was 47° at Beckley (Fire Weather Station).

PRECIPITATION

The average monthly precipitation for the State, based on the records of 115 stations, was 4.83 inches, or 0.77 inch above the normal. In the northeastern panhandle division the average was 4.81 inches; in the northern division, 4.41 inches; and in the southern division, 5.47 inches. The greatest monthly precipitation was 11.34 inches at Rainelle and the least, 2.14 inches at Institute. The greatest amount in any 24 consecutive hours was 4.54 inches at Rainelle on the 14th. The average number of days with .01 inch or more of precipitation was 11.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. |||| Incomplete.

VOL. XLVIII PARKERSBURG, W. VA., SEPTEMBER 1940 No. 9

GENERAL SUMMARY

The month was the fourth coolest September of record, with all stations reporting mean temperatures below normal. The deficiencies ranged from 0.1° at Point Pleasant to 6.7° at Bayard, with only one station reporting less than one degree and eight stations reporting five degrees or more. The minimum temperature of 21° at Thornwood (Fire Weather Station) on the 12th and at McNeill on the 27th was the lowest of record for the State for September. Light to heavy frosts on the 26-27th were rather general over the State, while killing frosts were confined mostly to the high-level stations in the northeastern and eastern counties on the 26-27th, and a few stations on the 11-12th.

The average precipitation for the State was slightly below normal, the areas of greatest deficiencies being in the southeastern and east-central counties. Also below normal were the northern panhandle and the northwestern counties. The precipitation in the northeastern panhandle and the central portion of the State was considerably above normal. Most of the rain fell during the two periods (8-10th and 24-25th) when many thunderstorms occurred.

The weather was mostly favorable for farm activities. Corn harvesting was well under way at the close of the month. Dry soil in some localities held back germination and growth of fall-seeded crops.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 65 stations, was 62.2°, or 4.2° below the normal. The mean for the northeastern panhandle division was 61.3°; for the northern division, 62.2°; and for the southern division, 62.5°. The highest monthly mean was 67.8° at Huntington and the lowest, 54.2° at Bayard. The highest temperature was 98° at Glenville on the 20th, and the lowest, 21° at Thornwood (Fire Weather Station) on the 12th and McNeill on the 27th. The greatest daily range was 51° at Thornwood (Fire Weather Station) on the 7th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 120 stations, was 2.88 inches, or 0.02 inch below the normal. In the northeastern panhandle division the average was 3.15 inches; in the northern division, 3.31 inches; and in the southern division, 2.18 inches. The greatest monthly precipitation was 5.63 inches at Belington and the least, 0.50 inch at White Sulphur Springs. The greatest amount in any 24 consecutive hours was 4.14 inches at Midvale on the 24-25th. The average number of days with .01 inch or more of precipitation was 5.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. |||| Incomplete.

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. XLVIII PARKERSBURG, W. VA., OCTOBER 1940 No. 10

GENERAL SUMMARY

Precipitation averaged 63 per cent of normal. The greatest deficiency (42 per cent) occurred in the southern division. A large area in the extreme southern part of the state had precipitation totals for the month of less than one inch. Only one station, Harpers Ferry, reported total precipitation in excess of normal. Thirty-three stations, most of them in the northeastern panhandle division and the northeastern part of the northern division, reported snowfall on the 19th and 20th.

The mean temperature for the entire state averaged 0.3° below the normal. The northeastern panhandle division was consistently below normal, while several stations in the southeastern part of the state and a large number in the central and north-central part were above normal.

Dry weather and generally mild temperatures were favorable for the maturing and the harvesting of most late crops. However, in many sections pastures were declining at the close of the month due to the lack of rain. Winter grains were a little late because of slow germination.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 64 stations, was 54.3°, or 0.3° below the normal. The mean for the northeastern panhandle division was 52.7°; for the northern division, 54.3°; and for the southern division, 54.9°. The highest monthly mean was 59.6° at Huntington and the lowest, 47.4° at Bayard. The highest temperature was 88° at three stations, Huntington on the 13th and 14th and Logan and Weston on the 14th, and the lowest, 18° at Seneca State Forest on the 21st and Pickens on the 22d. The greatest daily range was 65° at McNeill on the 12th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 117 stations, was 1.80 inches, or 1.04 inches below the normal. In the northeastern panhandle division the average was 2.06 inches; in the northern division, 2.19 inches; and in the southern division, 1.13 inches. The greatest monthly precipitation was 4.27 inches at Kumbrabow State Forest and the least, 0.35 inch at Mullens. The greatest amount in any 24 consecutive hours was 1.80 inches at Cairo on the 30th. The average monthly snowfall was 0.4 inch, or 0.1 inch above the normal. The greatest monthly snowfall was 6.0 inches at Spruce Knob. The average number of days with .01 inch or more of precipitation was 8.

ALLEN SMITH

Allen Smith of Lost Creek died October 24th, 1940 at the age of 64. Mr. Smith commenced observations in May 1895, and at the time of his death was the oldest cooperative observer in point of service in West Virginia. His reports were always prompt, neat and scrupulously accurate, and the service witnesses his passing with more than ordinary regret.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. |||| Incomplete.

Daily Precipitation for October 1940

VOL. XLVIII PARKERSBURG, W. VA., NOVEMBER 1940 No. 11

GENERAL SUMMARY

The month was somewhat above normal in precipitation, and the rains and snows were quite well distributed throughout the month, both as to amounts and as to days. Heavy rains of from one to slightly over two inches fell at most stations on the 1st and 2d. Snows of the 15-16th blanketed practically the entire state, with depths up to 6.5 inches being reported. In most cases the snow disappeared in about four days. Another snowfall of less than three inches occurred on the 27-28th, with some sleet reported from the mountain sections.

The average temperature for the state was exactly normal. The northeastern panhandle, the central, and the southwestern sections were generally above normal in temperature. No zero temperatures were recorded. The cold periods were on the 9th, 15-16th, 17-19th, and the 28-29th. The warm periods were from the 1st-5th, 11th, and the 20-24th.

Winter grains and pastures improved during the month, while outdoor activities were hampered by inclement weather much of the time.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 64 stations, was 43.2°, or exactly normal. The mean for the northeastern panhandle division was 43.3°; for the northern division, 42.9°; and for the southern division, 43.5°. The highest monthly mean was 48.2° at Huntington and the lowest, 35.4° at Bayard. The highest temperature was 80° at Huntington and Institute on the 4th and the lowest, 4° at Seneca State Forest on the 29th. The greatest daily range was 54° at McNeill on the 4th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 122 stations, was 3.27 inches, or 0.53 inch above the normal. In the northeastern panhandle division the average was 3.72 inches; in the northern division, 3.69 inches; and in the southern division, 2.50 inches. The greatest monthly precipitation was 6.38 inches at Kearneysville, and the least 1.20 inches at Kanawha Falls. The greatest amount in any 24 consecutive hours was 2.25 inches at Shinnston on the 1st. The average monthly snowfall was 3.8 inches, or 1.3 inches above normal. The greatest monthly snowfall was 12.0 inches at Alpena. The average number of days with .01 inch or more of precipitation was 11.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. ‖‖ Incomplete.

VOL. XLVIII PARKERSBURG, W. VA., DECEMBER 1940 No. 12

GENERAL SUMMARY

This was the warmest December since 1931 and was the fifth warmest of record. The mean temperature of no station was reported as below normal for the month. Excesses of temperature ranged from 4.0° at Union to 10.6° at Parsons. Temperatures of zero or lower were recorded on the 3d in Randolph and Pocahontas counties, on the 4th in Grant, Preston, Hardy, Randolph, Pocahontas, Nicholas, Greenbrier, and Monroe counties, and again on the 5th in Grant county.

With the exception of the northern panhandle and along the Ohio River in Wetzel and northern Pleasants counties and also in the eastern part of the northeastern panhandle division, the State averaged much below normal in precipitation.

The average snowfall, 0.8 inch, was the second smallest amount on record and was the least recorded since 1931 when only 0.3 inch occurred.

Winter grains and pastures were in average condition at the close of the month, and farm work was about up to date.

C. L. W.

TEMPERATURE

The average monthly temperature for the State, based on the records of 65 stations, was 40.4°, or 5.7° above the normal. The mean for the northeastern panhandle division was 38.4°; for the northern division, 40.7°; and for the southern division, 40.9°. The highest monthly mean was 45.0° at Huntington and the lowest, 30.8° at Bayard. The highest temperature was 72° at Valley Chapel on the 16th and 17th and the lowest, −11° at Terra Alta on the 4th. The greatest daily range was 55° at Bayard on the 24th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 124 stations, was 2.31 inches, or 0.96 inch below the normal. In the northeastern panhandle division the average was 2.00 inches; in the northern division, 2.72 inches; and in the southern division, 1.87 inches. The greatest monthly precipitation was 4.13 inches at New Martinsville, and the least, 1.19 inches at Kanawha Falls and Madison. The greatest amount in any 24 consecutive hours was 1.70 inches at Romney on the 16th. The average monthly snowfall was 0.8 inch, or 5.3 inches below the normal. The greatest monthly snowfall was 7.5 inches at Terra Alta. The average number of days with .01 inch or more of precipitation was 12.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. ‖ Incomplete. [h] 8 days missing.

Daily Precipitation for December 1940

U. S. DEPARTMENT OF COMMERCE, WEATHER BUREAU

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

Vol. XLVIII PARKERSBURG, W. VA., YEAR 1940 No. 13

GENERAL SUMMARY

The average temperature for the State was 51.4°, or 1.6° below the normal. It was, together with 1904, the third coldest year of record. Only three months were above normal in temperature. January was the coldest month, with a mean temperature of 20.5°, and was also the coldest January of record. Ice in the rivers caused suspension of navigation almost throughout the month. The ground was frozen to such a depth that normal seepage was stopped, causing the supply of potable water to become low in many localities. Spring averaged 2.6° deficiency in temperature, and the beginning of Summer found all crops from two to four weeks late. The warmest month was July, 72.5°. The lowest monthly mean temperature was 13.6° at Terra Alta in January, and the highest, 77.2° at Huntington in July and August. The annual mean temperature ranged from 44.1° at Bayard to 56.2° at Huntington. The highest temperature was 103° at Martinsburg on July 26th; the lowest, —24° at Benson January 19th.

The mean annual precipitation, 44.53 inches, was 1.43 inches above the normal. It was the wettest year since 1937, when the total was 49.76 inches. The wettest month was June, with a State average of 5.97 inches. In April, heavy rains in the second decade brought flood conditions to the Ohio and also to the Little Kanawha and West Fork Rivers. Heavy rains on the 13-14th of August resulted in the New and the Great Kanawha Rivers above Charleston exceeding their flood stages by many feet and causing considerable damage to barges and lowland dwellings. Precipitation during the growing season exceeded the normal by about 15 per cent.

Considering that all growing months except June were below normal in temperature, it was still a good year for all crops. Above normal amounts of precipitation during the growing season followed by a mild dry Fall allowed for the slow maturing of late crops. The growing season averaged 156 days.

VOL. XLIX PARKERSBURG, W. VA., JANUARY 1941 No. 1

GENERAL SUMMARY

The month averaged very nearly normal in temperature, being only 0.1° below the normal. There were two cold periods: 5-8th and 19th-22d. The warm periods in the northeastern panhandle division were: 1st-3d, and the 15-17th; in the northern division were: 1st-3d, 12-14th, and the 22d-24th; in the southern division were: 1st-3d, 17-18th, and 22-23d. Temperatures of zero or lower were reached generally at the higher elevations on the 21st and also at a few southern stations on the 6th.

Except for a few places in the northeastern panhandle division, all stations were below normal in precipitation. Deficiencies were two inches or more in Wayne, Boone and Logan counties, the greatest being 2.61 inches below the normal at Logan. On the 25th the northern panhandle counties were hit by a heavy snowfall, followed by sleet and then rain, making highway travel hazardous. Hancock county reported a five-inch snowfall. At the same time the Allegheny mountains were swept by a sleet storm which affected travel in Mineral, Grant, Hampshire and Preston counties. On the 26-27th the mountain sections were again blanketed with a six-inch snow. The deepest snows were in Preston, Tucker, Randolph, Grant, Hampshire, and Hardy counties. The greatest number of snow-lying days was at Stony River Dam, where for 20 days there was measurable snow upon the ground.

The navigable rivers were ice-free throughout the month. Winter grains and pastures were in good condition at the close of the month.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 66 stations, was 32.5°, or 0.1° below the normal. The mean for the northeastern panhandle division was 30.0°; for the northern division, 32.6°; and for the southern division, 33.3°. The highest monthly mean was 36.8° at Huntington and the lowest, 24.6° at Bayard. The highest temperature was 66° at Parsons on the 2d and the lowest, −6° at Terra Alta on the 21st. The greatest daily range was 52° at Bayard on the 22d.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 125 stations, was 2.73 inches, or 0.90 inch below the normal. In the northeastern panhandle division the average was 2.15 inches; in the northern division, 3.03 inches; and in the southern division, 2.59 inches. The greatest monthly precipitation was 6.27 inches at Pickens and the least, 1.07 inches at Brandywine. The greatest amount in any 24 consecutive hours was 1.37 inches at Pickens on the 16th. The average monthly snowfall was 5.1 inches, or 2.9 inches below the normal. The greatest monthly snowfall was 22.5 inches at Alpena. The average number of days with .01 inch or more of precipitation was 12.

The departures from the normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. § Also on other dates. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc.

Daily Precipitation for January 1941

VOL. XLIX PARKERSBURG, W. VA., FEBRUARY 1941 No. 2

GENERAL SUMMARY

This was the coldest February since 1936. Its mean temperature of 29.2° was 4.1° below the normal. At no station was a mean temperature in excess of the normal recorded. The cold periods were the 4-6th, 10-12th, and the 18-24th. Temperatures of zero or lower were recorded at several high-level stations on the 5th, 10th, 19th and the 24th.

It was the second driest February of record, being exceeded only by February 1901, which had a total precipitation of 0.86 inch. All stations reported precipitation below normal. The northeastern panhandle division averaged 24 percent of normal while the northern and southern divisions averaged 32 percent of their normal precipitation. As the greater part of the precipitation fell as snow and was well distributed throughout the month, soil moisture seemed adequate in most sections. The greatest number of snow-lying days occurred at Spruce Knob and at Pickens No. 2 where measureable snow covered the ground throughout the month. Snow cover in the mountains remained fairly heavy at the close of the month. The thin ice formations in the Ohio River from the 19th to the 28th caused no hindrances to navigation.

Frequent cold spells slowed farm activities down to the minimum and were also a hindrance to outdoor construction work. Growth of winter grains and grasses were retarded. No important heaving was reported, although snow cover was lacking in many growing areas.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 66 stations, was 29.2°, or 4.1° below the normal. The mean for the northeastern panhandle division was 29.3°; for the northern division, 28.7°; and for the southern division, 29.7°. The highest monthly mean was 34.6° at Huntington and the lowest, 20.2° at Bayard. The highest temperature was 66° at Huntington on the 12th and the lowest, −11° at Seneca State Forest on the 10th. The greatest daily range was 57° at Thornwood (Fire-Weather Station) on the 10th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 126 stations, was .96 inch, or 2.17 inches below the normal. In the northeastern panhandle division the average was .59 inch; in the northern division, 1.04 inches; and in the southern division, 1.02 inches. The greatest monthly precipitation was 3.37 inches at Pickens, and the least, .10 inch at Moorefield (Hydrologic Station). The greatest amount in and 24 consecutive hours was .95 inch at Kumbrabow State Forest on the 17th. The average monthly snowfall was 9.3 inches, or .8 inch above the normal. The greatest monthly snowfall was 49.0 inches at Alpena. The average number of days with .01 inch or more of precipitation was 8.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Interpolated.

Daily Precipitation for February 1941

VOL. XLIX PARKERSBURG, W. VA., MARCH 1941 No. 3

GENERAL SUMMARY

Following a February that was cold and the second driest of record, this month was the second coldest and the fifth driest March, making the two-month period just ended the driest and second coldest of any similar period of record. This was an unusual situation, as occasional records for a single weather element, temperature or precipitation, may to a great degree conform in summarizations for two succeeding months, but it is rare for both elements to exhibit such similarity. The mean temperature for every station in the State was below normal. The departures from normal ranged from −13.9° at Logan to −1.3° at Marlinton. Temperatures of zero or lower were recorded during the month in Preston, Grant, Tucker, Marion, Taylor, Randolph, Pocahontas, Raleigh and Greenbrier counties.

It was the fourth consecutive month with the precipitation average below normal. The northeastern panhandle division averaged 54 per cent of normal, the northern division, 44 per cent, and the southern division, 57 per cent. The average snowfall of 12.2 inches was 6.3 inches above the normal. The greatest number of snow-lying days was 28 at Spruce Knob.

Fruit trees remained dormant throughout the month, and winter grains and pastures were delayed by the cold dry weather. Farm activities were mostly in the way of land preparation and potato seeding.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 65 stations, was 34.8°, or 7.5° below the normal. The mean for the northeastern panhandle division was 34.8°; for the northern division, 33.5°; and for the southern division, 35.9°. The highest monthly mean was 40.0° at Huntington and the lowest, 25.4° at Bayard. The highest temperature was 72° at Seneca State Forest on the 22d and 23d; and the lowest, −7° at Alpena on the 2d. The greatest daily range was 58° at Seneca State Forest on the 22d.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 124 stations, was 1.95 inches, or 1.94 inches below the normal. In the northeastern panhandle division the average was 1.65 inches; in the northern division, 1.78 inches; and in the southern division, 2.33 inches. The greatest monthly precipitation was 4.74 inches at Mullens, and the least, .71 inch at Shinnston. The greatest amount in any 24 consecutive hours was 1.42 inches at Piedmont on the 7-8th. The average monthly snowfall was 12.2 inches, or 6.3 inches above the normal. The greatest monthly snowfall was 38.0 inches at Pickens No. 2. The average number of days with .01 inch or more of precipitation was 10.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. |||| Incomplete.

Daily Precipitation for March 1941

VOL. XLIX PARKERSBURG, W. VA., APRIL 1941 No. 4

GENERAL SUMMARY

The month was the second warmest April of record. The period 8–20th, inclusive, was exceptionally warm. The period 22d–27th, inclusive, was slightly below normal in temperature. All stations were above normal in temperature for the month. Frosts in the last decade caused no appreciable damage.

For the five months, December 1940 to April 1941, inclusive, the State had only 58 percent of normal precipitation, the least of record for this period. It was the fifth driest April of record. Hinton was the only station whose precipitation was above normal for the month. The near-drought conditions accentuated the forest fire hazard, which finally climaxed in 150 fires by the 21st. One fire-fighter lost his life near the Braxton County game refuge. Several thousand acres of timber, several homes, and a school were destroyed. These fires were brought under control with the aid of the showers of the 23d and 24th. For the third time since the beginning of the record the average snowfall for April was only a trace. Only one station, Spruce Knob, with two inches, had a measurable amount of snow during the month.

It was a good month for ground preparation and planting. However, lack of adequate precipitation retarded germination of seeds and the growth of vegetation. Fruit trees bloomed heavily during the month. Farm work was kept up to date. It was a very favorable month for outdoor construction work.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 61 stations, was 56.0°, or 4.2° above the normal. The mean for the northeastern panhandle division was 55.1°; for the northern division, 56.0°; and for the southern division, 56.3°. The highest monthly mean was 60.9° at Huntington and the lowest, 47.8° at Alpena. The highest temperature was 96° at Madison and Martinsburg on the 20th and the lowest, 15° at Pickens on the 2d. The greatest daily range was 61° at Brownsville on the 27th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 121 stations, was 2.17 inches, or 1.38 inches below the normal. In the northeastern panhandle division the average was 2.09 inches; in the northern division, 2.10 inches; and in the southern division, 2.31 inches. The greatest monthly precipitation was 4.12 inches at Pickens and the least, 0.37 inch at Shinnston. The greatest amount in any 24 consecutive hours was 1.90 inches at Inwood on the 5th. The average snowfall was Trace, or 1.7 inches below the normal. The greatest monthly snowfall was 2.0 inches at Spruce Knob. The average number of days with .01 inch or more of precipitation was 7.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, [a] one day, [b] two days etc. § Also on other dates. |||| Incomplete.

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

OL. XLIX PARKERSBURG, W. VA., MAY 1941 No. 5

GENERAL SUMMARY

The month was the seventh driest May of record. Precipitation averaged from 69 percent of normal in the northern division to 42 percent in the southern division. For the six months, December 1940 to May 1941, inclusive, the state had nly 58 percent of normal precipitation, the least of record for his period. Deficiencies of two inches or over were recorded n the southern and southeastern parts of the state. Near rought conditions were general in the southern and southeastrn portions of the state at the close of the month.

Temperatures averaged slightly above normal at practically ll stations except those in the mountain areas. However, the irst half of the month was rather cold with frequent cold ights. The period 9–14th was abnormally cold, while the eriods 21st–22d and 27-29th were very warm. Heavy frosts, nd in exposed places, killing frosts, occurred in the period of he 11th to 14th. Heavy frost also occurred in widely scattered ocalities on the 25th

Frosts and dry soil contributed to the slow growth of crops uring the month. The early hay crop was very light and hort. Generous rains and warm weather were needed at the lose of the month.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the ecords of 64 stations, was 62.2°, or 0.5° above the normal. The mean for the northeastern panhandle division was 62.5°; or the northern division, 61.6°; and for the southern division, 2.8°. The highest monthly mean was 68.2° at Huntington nd the lowest, 51.7° at Bayard. The highest temperature was 02° at Hinton on the 22d, and the lowest, 20° at Seneca State Forest on the 3d and Bayard on the 4th. The greatest daily ange was 64° at Romney on the 2d.

PRECIPITATION

The average monthly precipitation for the State, based on the ecords of 123 stations, was 2.28 inches, or 1.66 inches below he normal. In the northeastern panhandle division the average vas 1.97 inches; in the northern division, 2.83 inches; and in he southern division, 1.59 inches. The greatest monthly precipitation was 4.45 inches at Pickens No. 2 and Wellsburg and he least, 0.57 inch at Greenbottom and Naoma. The greatest mount in any 24 consecutive hours was 2.68 inches at Pickens n the 17th. The average monthly snowfall was Trace, or the normal amount. The greatest monthly snowfall was trace at Spruce Knob. The average number of days with .01 inch or more of precipitation was 7.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. ||| Incomplete.

VOL. XLIX PARKERSBURG, W. VA., JUNE 1941 No. 6

GENERAL SUMMARY

Following six consecutive months of precipitation deficiencies, the past month was the third wettest June of record. The bulk of the rainfall occurred in the first two decades. All stations except those on the extreme southwest and extreme southeast borders and a few in the eastern counties reported precipitation in excess of the normal. The excess ranged up to 6.06 inches at St. Marys. Heavy to excessive rains in the second week caused considerable damage to crops on the bottom lands in the northwestern basins. Much damage was caused by flood waters at Hundred, West Virginia, on June 3d. About a dozen business houses and as many homes were affected. Stages in Fish Creek, Fishing Creek, and Middle Island Creek were the highest since 1913. Other communities affected by the high water were Mannington, Cameron, Littleton and Pine Grove.

Temperature means were above normal at most stations. However, a few stations in the eastern counties reported mean temperatures slightly below normal. The 6–7th and the 11th and 17th were the cool periods, while the third decade was warm.

Farm crops generally made good growth during the month. The first cutting of the meadows was very light due to previous near drought conditions. Wheat was also adversely affected. The close of the month saw most crops at about normal advancement and in good condition with farm work about up to date.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 62 stations, was 70.1°, or 0.4° above the normal. The mean for the northeastern panhandle division was 68.8°; for the northern division, 69.9°; and for the southern division, 70.8°. The highest monthly mean was 75.8° at Huntington and the lowest, 60.5° at Alpena. The highest temperature was 101° at Huntington on the 28th, and the lowest, 31° at Bayard on the 11th. The greatest daily range was 48° at McNeill on the 7th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 125 stations, was 6.03 inches, or 1.56 inches above the normal. In the northeastern panhandle division the average was 4.80 inches; in the northern division, 7.35 inches; and in the southern division, 4.53 inches. The greatest monthly precipitation was 10.39 inches at Hastings and the least, 2.79 inches at Branchland. The greatest amount in any 24 consecutive hours was 3.71 inches at Brandonville on the 4th. The average number of days with .01 inch or more of precipitation was 14.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitatio with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period o record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. ‖ Incomplete.

Daily Precipitation for June 1941

VOL. XLIX PARKERSBURG, W. VA., JULY 1941 No. 7

GENERAL SUMMARY

The month was the warmest July since 1936. Monthly means were below normal at only four stations (in Mason, Grant, Hampshire and Jefferson Counties). The warm periods were 1st–2d and 26th–31st, with readings of 100° or better occurring at fourteen stations. The nights were rather cool on the 9–10th and 21st–22d. The rainfall averaged three-fourths of an inch above normal. It was well distributed during the first decade and the last two or three days of the month and somewhat scattered during the middle decade. The greatest concentration of fall was over Cabell, Lincoln and Tyler Counties where monthly totals were in excess of eight inches. Deficiencies occurred only in Berkeley and Jefferson Counties in the northeastern panhandle division, Randolph and Lewis and portions of Upshur, Taylor, Harrison, Marshall and Brooke Counties in the northern division, and Roane, Summers, northern Pocahontas and southwestern Greenbriar Counties in the southern division. It was the second successive month with precipitation above normal following six successive months with deficient precipitation. Drought conditions were only slightly checked and the ground water table continued dry. A severe thunderstorm passed over Huntington on the 12th flooding streets and basements and causing damage to buildings estimated at $8000. An interesting feature of this storm, which prevailed from 6:25 p.m. to about 8:30 p.m., was the concentration of rainfall over the central portion of the city. At the Post Office the total fall was 3.24 inches, while about two miles to the northeast, at the cooperative station, the fall was 3.02 inches, and three miles to the west, at the airport, the fall was 1.20 inches. At Dam 29, O. R., eleven miles to the west, there was no rain. The gage at the Post Office recorded .50 inch in 5 minutes, 1.15 inches in 15 minutes, 1.80 inches in 30 minutes, and 3.05 inches in 60 minutes.

The weather was generally favorable for crop growth, although the hot dry weather at the close developed a need for substantial showers.

TEMPERATURE

The average monthly temperature for the State, based on the records of 64 stations, was 74.4°, or 1.2° above the normal. The mean for the northeastern panhandle division was 73.7°; for the northern division, 74.3°; and for the southern division, 74.8°. The highest monthly mean was 79.4° at Williamson and the lowest, 66.2° at Bayard. The highest temperature was 105° at Inwood on the 28th, and the lowest, 37° at Thornwood (Fire Weather Station) on the 21st. The greatest daily range was 47° at Alpena and Seneca State Forest on the 10th and McNeill on the 10th and 21st.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 123 stations, was 5.39 inches, or 0.77 inch above the normal. In the northeastern panhandle division the average was 4.65 inches; in the northern division, 5.22 inches; and in the southern division, 6.03 inches. The greatest monthly precipitation was 9.18 inches at Huntington and the least, 2.07 inches at Kearneysville. The greatest amount in any 24 consecutive hours was 3.35 inches at Sutton on the 4th. The average number of days with .01 inch or more of precipitation was 13.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, [a] one day, [b] two days etc. § Also on other dates. * Estimated.

Daily Precipitation for July 1941

VOL. XLIX PARKERSBURG, W. VA., AUGUST 1941 NO. 8

GENERAL SUMMARY

The past month was the coolest August since 1930. All stations averaged below normal in temperature except those in the extreme south and southeast portions and a few in the northwest part of the State. Light frost occurred in the mountains of Taylor county on the night of the 14th.

Precipitation was considerably in excess of the normal in the northern division and all but the extreme northern part of the northeastern panhandle division, while the southern division averaged almost one-half inch below normal with the eastern and western counties being particularly dry. The greatest concentration of precipitation was in the north-central section, where the total was more than twice as much as in the Ohio Valley. A thunderstorm on the afternoon of the 9th caused damage to the electric lines between the north part of Parkersburg and St. Marys. Trees were uprooted, tearing down power lines during their fall. A considerable amount of large hail stones fell without, however, causing noteworthy damage.

The deficiency of precipitation during the winter months caused a serious lack of subsoil moisture during the growing months. This was very evident in August when a few dry days were immediately followed by the firing of the leaves on corn and tobacco and the rapid browning of meadows. Where showers were timely, growth of vegetation was normal or better. In those sections where showers occurred at intervals of more than a week, shallow-rooted plants and those with large heavy leaves suffered for lack of moisture that would normally have risen by capillary tension.

TEMPERATURE

The average monthly temperature for the State, based on the records of 63 stations, was 71.2°, or 0.6° below the normal. The mean for the northeastern panhandle division was 70.5°; for the northern division, 70.6°; and for the southern division, 72.1°. The highest monthly mean was 77.0° at Huntington and Williamson, and the lowest, 62.1° at Bayard. The highest emperature was 102° at Inwood on the 9th, and the lowest, 32° at Bayard on the 14th. The greatest daily range was 50° at Alpena on the 14th and McNeill on the 8th and 14th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 126 stations, was 4.80 inches, or 0.72 inch above he normal. In the northeastern panhandle division the average was 4.63 inches; in the northern division, 5.59 inches; and in he southern division, 3.69 inches. The greatest monthly precipitation was 8.70 inches at Hall and the least, 1.97 inches at Greenbottom and Wayne. The greatest amount in any 24 consecutive hours was 3.50 inches at New Cumberland on the 5th. The average number of days with .01 inch or more of precipitation was 9.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitatio with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period o record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Estimated.

Daily Precipitation for August 1941

'OL. XLIX PARKERSBURG, W. VA., SEPTEMBER 1941 No. 9

GENERAL SUMMARY

The month was well above normal in temperature, the only leficiencies being at a few stations in the extreme north-central art of the state. Light frosts were quite general on the 13th nd 21st with two stations listing a killing frost on the 13th, and ne on the 21st.

The average precipitation for the state was 77 per cent of normal. The greatest deficiencies occurred in the northeastern anhandle division, where the average was the second smallest f record for September. The entire northern half of the state, ith the exception of some stations in Pleasants, Ritchie, Wirt nd Wood counties and also about one-half the stations scattered ver the southern division reported precipitation deficiencies. n unusual number of days with dense fogs were recorded during the month and they were especially numerous during the econd decade and the first half of the third decade. Light hail ll at Beckley on the 3d. Many thunderstorms occurred during the first decade but none were recorded after the 11th. A olt of lightning, during a severe thunderstorm on the 1st, killed woman on a golf course near Parkersburg. A heavy thundertorm with high wind caused extensive damage to Wheeling, on he night of the 5th. Two large smokestacks were toppled causng damage estimated at $75,000, and electric power service was ut off for several hours. Light to heavy showers, during the rst decade of the month, retarded the spread of drought condiions, but the second and third decades were almost rainless and he end of the month saw farm water supplies at a critical low vel in some localities, while pastures and most forage crops ere brown and dry. All outdoor activities were favored by the eather, especially during the latter half of the month. Corn nd apple picking, and the seeding of wheat and barley were in ll swing at the close.

During the growing season just ended, an abundance of the major rops were secured, due to the fact that the months of June, July, and ugust had excesses of from three-quarters to one and one-half inches of ain. This and the timeliness of the showers offset the deficiencies of the arly months and the lack of sub-soil moisture to a great extent. During he "water year" just ended, from October 1, 1940 to September 30, 1941 he precipitation averaged 83 per cent of normal.—C.L.W.

TEMPERATURE

The average monthly temperature for the State, based on the records f 66 stations, was 67.8°, or 1.4° above the normal. The mean for the ortheastern panhandle division was 66.9°; for the northern division, 7.4°; and for the southern division, 68.5°. The highest monthly mean as 73.8° at Huntington and the lowest, 59.6° at Bayard. The highest emperature was 99° at Ravenswood on the 10th, and the lowest, 26° at ayard on the 13th and 21st. The greatest daily range was 59° at IcNeill on the 23d.

PRECIPITATION

The average monthly precipitation for the State, based on the records f 128 stations, was 2.22 inches, or 0.66 inch below the normal. In the ortheastern panhandle division the average was 1.03 inches; in the orthern division, 2.35 inches; and in the southern division, 2.58 inches. 'he greatest monthly precipitation was 5.97 inches at Summersville and he least, 0.35 inch at Knobly Mt. The greatest amount in any 24 conecutive hours was 2.77 inches at Wayne on the 10-11th. The average umber of days with .01 inch or more of precipitation was 7.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Estimated.

Daily Precipitation for September 1941

VOL. XLIX PARKERSBURG, W. VA., OCTOBER 1941 No. 10

GENERAL SUMMARY

The mean temperature for the State averaged 4.9° above the normal, with every station in the State recording a plus departure. Huntington had the greatest departure, being 9.0° above the normal. The first decade was extremely warm, the second was somewhat above normal, and the third averaged just about normal in temperature. Killing frosts and freezes had brought the growing season to an end in most localities by the close of the month.

The average precipitation for the State was about normal. However, the northern division and the Ohio River counties of the southern division were well in excess of normal; elsewhere in the southern division the average was considerably below normal, while the northeastern panhandle division and the extreme eastern counties of the southern division remained very dry. Drought conditions were generally relieved by October rains except in the northeastern panhandle division and the extreme eastern counties of the southern division. No snowfall was reported from any station during the month. This was the seventh time in forty-eight years of record that snowfall was not recorded at any station during the month of October.

The weather was favorable for outdoor activities and farm work was kept about up to normal. Winter grains and grasses were benefited by frequent rains in most sections and were in fair to good condition at the close of the month.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 63 stations, was 59.6°, or 4.9° above the normal. The mean for the northeastern panhandle division was 58.9°; for the northern division, 59.3°; and for the southern division, 60.2°. The highest monthly mean was 65.4° at Huntington and the lowest, 51.5° at Bayard. The highest temperature was 99° at Inwood on the 5th, and the lowest, 17° at Seneca State Forest on the 29th. The greatest daily range was 58° at McNeill on the 12th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 123 stations, was 2.89 inches, or 0.05 inch above the normal. In the northeastern panhandle division the average was 1.26 inches; in the northern division, 3.68 inches; and in the southern division, 2.48 inches. The greatest monthly precipitation was 6.20 inches at Pickens and the least, 0.40 inch at Berkeley Springs. The greatest amount in any 24 consecutive hours was 1.54 inches at New Cumberland on the 15th. No snowfall was reported from any station during the month. The average number of days with .01 inch or more of precipitation was 12.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Estimated.

Daily Precipitation for October 1941

VOL. XLIX PARKERSBURG, W. VA., NOVEMBER 1941 No. 11

GENERAL SUMMARY

The month was well above normal in temperature, although a few widely scattered stations reported slight deficiencies. The warm periods were from the 1st–6th and the 14–20th, inclusive. The cold periods were from the 8–12th and the 22d–26th, inclusive. No zero temperatures were recorded.

A considerable deficiency in precipitation has been reported from all stations except a few along the Ohio River and several in the northeastern panhandle division. However, the precipitation was well distributed throughout the month. The very dry northeastern panhandle division had nearly normal precipitation which was helpful to the farm water supply and the stream flow. Snow flurries were quite general on the 8–11th and also on the 24th. At a few stations measurable snow fell on the 8th, 9th or 10th. Grafton and Parsons had sleet on the 6–7th, Logan on the 9th, and Romney and Beckley on the 22d. Thunderstorms occurred at widely scattered stations on the 6th and at Institute on the 20th.

Winter grains and pastures remained in good condition during the month. Construction work and other outdoor activities were aided by the mild weather most of the time. Corn husking and practically all harvesting remaining to be done were finished during the month.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 68 stations, was 44.3°, or 1.1° above the normal. The mean for the northeastern panhandle division was 44.8°; for the northern division, 44.2°; and for the southern division, 44.2°. The highest monthly mean was 47.9° at Huntington and the lowest, 38.2° at Bayard. The highest temperature was 80° at Hinton on the 1st and Martinsburg on the 5th, and the lowest, 6° at Seneca State Forest and Thornwood (Fire Weather Station) on the 25th. The greatest daily range was 62° at McNeill on the 15th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 124 stations, was 2.31 inches, or 0.42 inch below the normal. In the northeastern panhandle division the average was 2.32 inches; in the northern division, 2.40 inches; and in the southern division, 2.17 inches. The greatest monthly precipitation was 3.88 inches at Point Pleasant, and the least, 1.18 inches at New Cumberland. The greatest amount in any 24 consecutive hours was 1.92 inches at Briscoe on the 6th. The average monthly snowfall was 0.2 inch, or 2.2 inches below the normal. The greatest monthly snowfall was 2.5 inches at Pickens No. 2. The average number of days with .01 inch or more of precipitation was 7.

Lon J. Morehead

Mr. Lon J. Morehead of Belleville, W. Va., died November 16, 1941 at the age of 57. Since 1908 Mr. Morehead had been employed by the United States Engineers on locks in the Ohio and the Great Kanawha Rivers, the last ten years of which he was Lockmaster at Dam No. 20, O. R. As Lockmaster he was an earnest cooperator with the Weather Bureau, both in climatological and river-flood work. His passing is a real loss to both services.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Estimated.

Daily Precipitation for November 1941

VOL. XLIX PARKERSBURG, W. VA., DECEMBER 1941 No. 12

GENERAL SUMMARY

The month was dry and warm, being the sixth warmest December of record. The mean temperature for the month was reported as above normal at every station in the state. The excesses ranged from 2.1° at Clarksburg to 8.1° at Huntington. The warm periods were 1st–5th, 22d–27th. The cold periods were 10–12th, 21st, 29th–31st. No temperatures of zero or lower were reported during the month. All stations except a few in the extreme eastern part of the state were below normal in precipitation. The greatest deficiencies were in the western and central portions. Snowfall was scanty, being only 20% of the normal amount. Of all the stations reporting snowfall, only 46% of them had a measureable amount during the month. There were few snow-lying days during the month even at the higher elevations. Spruce Knob and Pickens No. 2 had 9 days with snow-cover which was the greatest number of snow-lying days reported. There were no severe storms or floods. Sleet was quite general on the 13th in the northern portion of the state, while several thunderstorms occurred on the 24th in widely scattered localities. Winter grains were in good condition at the close of the month. Mild days and dry weather permitted farm work and other outdoor activities to progress throughout the month.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 69 stations, was 39.3°, or 4.5° above the normal. The mean for the northeastern panhandle division was 37.4°; for the northern division, 39.3°; and for the southern division, 40.0°. The highest monthly mean was 43.7° at Huntington and the lowest, 31.6° at Bayard. The highest temperature was 74° at Gary on the 3d, Grafton on the 4th, and Hinton on the 5th, and the lowest, 2° at Seneca State Forest on the 30th. The greatest daily range was 51° at Middlebourne on the 21st.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 126 stations, was 2.24 inches, or 1.01 inches below the normal. In the northeastern panhandle division the average was 2.38 inches; in the northern division, 2.08 inches; and in the southern division, 2.24 inches. The greatest monthly precipitation was 4.10 inches at Kearneysville, and the least, 1.10 inches at McNeill. The greatest amount in any 24 consecutive hours was 2.17 inches at Kearneysville on the 13th. The average monthly snowfall was 1.0 inch, or 5.0 inches below the normal. The greatest monthly snowfall was 7.5 inches at Alpena. The average number of days with .01 inch or more of precipitation was 9.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ᵃ one day, ᵇ two days etc. § Also on other dates. * Estimated.

Daily Precipitation for December 1941

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

Vol. XLIX PARKERSBURG, W. VA., YEAR 1941 No. 13

GENERAL SUMMARY

The year was practically normal as to temperature. The average was 53.4° or 0.4° above normal. Four months, January, February, March, and August were below normal in temperature, while the remainder were above normal. February was the coldest month with a mean temperature of 29.2°. March was very cold (second coldest March of record) and dry, retarding the start of spring until April. April and May were very warm and dry, being good ground preparation and seeding weather, however, lack of moisture contributed to slow growth of crops, especially hay. Severe frosts of May 11–14th killed the fruit crop on lower elevations. During the dry April weather, forest fires broke out and began to increase, climaxing in 150 fires on the 21st. One firefighter lost his life. Several thousand acres of timber, several homes and a school were destroyed. With the aid of showers on April 23d-24th these fires were brought under control. The warmest month was July, 74.4°. September and October were moderately warm allowing for good maturing conditions. The lowest monthly mean temperature was 20.2° at Bayard in February, and the highest, 79.4 at Williamson in July. The annual mean temperatures ranged from 45.3° at Bayard to 58.6 at Huntington. The highest temperature was 105° at Inwood on July 28th; the lowest -11° at Seneca State Forest on Februery 10th.

The mean annual precipitation, 35.97 inches, was 6.99 inches below the normal and the smallest annual amount since the drought year 1930. It was the 5th driest year of record. Only one statson, St. Marys, had a plus departure for precipitation. The total deficiency from January 1st to May 31st was 8.05 inches; then with a wet June the trend reversed and the three summer months of June, July, and August had a combined excess of 3.05 inches. The fall and the early winter were dry with a deficiency of 2.04 inches for the four months, September to December, inclusive. A flood at Hundred, W. Va. on the third of June caused much damage th business houses ane homes. The navigable rivers were practically ice-free during the calendar year.

Reports at the end of the growing season showed that the main farm crops has all been normal or somewhat above in yield. Construction work and other outdoor activities were hindered very little by the weather during the year. With the exception of the last week in January, the highways and roads were in passable condition throughout the year.

VOL. L PARKERSBURG, W. VA., JANUARY 1942 No. 1

GENERAL SUMMARY

The month averaged 1.9° below normal in temperature. The period 3d to 12th was extremely cold. Minimum temperatures of zero or lower were recorded on one date or another during the period 6th to 12th except at Williamson where the lowest temperature was 1°. The daily temperatures were generally above normal during the latter half of the month. The periods 17–20th, 24–25th, and 30th–31st were very mild. The area of greatest temperature deficiency was in the northern and the south-central parts of the state.

The average precipitation of 2.02 inches was the sixth smallest amount of record for the month of January. All stations were below normal in precipitation. Deficiencies of two inches or over occurred along the Ohio River from Marshall County to Kentucky, and also in Logan and Mingo Counties. The snowfall of the 3d-4th covered practically the entire state with a blanket of from two to nine inches. In addition to the snow, sleet occurred in the Clarksburg and Weston areas and somewhat delayed highway traffic. Pickens had the greatest monthly snowfall amount with 11.5 inches; Philippi had the greatest 24 hour snowfall with 9.0 inches; Pickens and Spruce Knob had the most snow-lying days, each having 20.

Navigation on the Ohio River was suspended on January 10th on account of ice and was not resumed until January 18th when the river became ice-free.

Winter grains and grasses were generally in good condition at the close of the month, the snow having protected them during the hard freezing weather of the first decade.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 71 stations, was 30.7°, or 1.9° below the normal. The mean for the northeastern panhandle division was 30.6°; for the northern division, 30.3°; and for the southern division, 31.1°. The highest monthly mean was 34.7° at Huntington and the lowest, 24.2° at Bayard. The highest temperature was 67° at Camp P–58 (Logan County), Gary, Logan, and McNeill on the 18th and Hinton on the 24th, and the lowest, −23° at Benson on the 8th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 129 stations, was 2.02 inches, or 1.58 inches below the normal. In the northeastern panhandle division the average was 1.64 inches; in the northern division, 2.09 inches; and in the southern division, 2.10 inches. The greatest monthly precipitation was 3.96 inches at Pickens, and the least, 1.16 inches at Franklin (Hydrologic Station). The greatest amount in any 24 consecutive hours was 1.67 inches at Thornwood on the 1st. The average monthly snowfall was 5.6 inches, or 2.3 inches below the normal. The greatest monthly snowfall was 11.5 inches at Pickens. The average number of days with .01 inch or more of precipitation was 8.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, [a] one day, [b] two days etc. § Also on other dates. * Estimated.

Daily Precipitation for January 1942

CLIMATOLOGICAL DATA

WEST VIRGINIA SECTION

S. S. SCHWORM

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. L PARKERSBURG, W. VA., FEBRUARY 1942 No. 2

GENERAL SUMMARY

February was cold with a mean temperature of 29.3°. At only one station (Point Pleasant) was a mean temperature in excess of the normal recorded. The cold periods were the 3d–4th, 9th, 13th, 19th–23d, and the warm periods were the 5–7th and the 15–18th. Temperatures of zero or lower were recorded quite generally on the 3d and at widely scattered stations on the 9th, 13th, and 20th.

Practically all stations reported precipitation below normal; only three stations were normal or very slightly above. A large number of stations in the southern division had deficiencies in excess of one inch. The northeastern panhandle division averaged 62% of normal, the northern division 77% and the southern division 67%. The rains and snows were well distributed throughout the month, and soil moisture seemed adequate in most places. The greatest number of snow-lying days occurred at Spruce Knob, which had 28. Navigation on the Ohio River was somewhat impeded by running ice on the 23d and 24th.

The ground was not protected by snow in many cases during the hard freezing weather of the 3d–4th and 9th. Apparently, however, there was little damage to winter grains and grasses by heaving.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 74 stations, was 29.3°, or 4.0° below the normal. The mean for the northeastern panhandle division was 29.1°; for the northern division, 28.5°; and for the southern division, 30.1°. The highest monthly mean was 34.4° at Huntington and the lowest, 20.4° at Bayard. The highest temperature was 66° at Ryan on the 15th and Madison on the 16th, and the lowest, −14° at Alpena on the 3d.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 124 stations, was 2.22 inches, or 0.90 inch below the normal. In the northeastern panhandle division the average was 1.50 inches; in the northern division, 2.51 inches; and in the southern division, 2.14 inches. The greatest monthly precipitation was 4.97 inches at Pickens No. 2, and the least, 0.81 inch at McNeill. The greatest amount in any 24 consecutive hours was 1.59 inches at Pickens No. 2 on the 8th. The average monthly snowfall was 6.9 inches, or 1.5 inches below the normal. The greatest monthly snowfall was 39.5 inches at Pickens No. 2. The average number of days with .01 inch or more of precipitation was 10.

Arnold C. Becker

Mr. Arnold C. Becker, cooperative rainfall observer at Stony River Dam since December 1920, passed away early in February 1942. Mr. Becker was born near Maysville, West Virginia, May 17, 1868, and had been caretaker at Stony River Dam since September 1, 1919. He rendered prompt and efficient service throughout his connection with the Weather Bureau, and his passing is announced with deep regret.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Pickens No. 2.

Daily Precipitation for February 1942

VOL. L PARKERSBURG, W. VA., MARCH 1942 No. 3

GENERAL SUMMARY

The month was slightly above normal in temperature. The first week and the last day of the month were rather cool. A warm period occurred on the 16–17th. Temperature of zero or lower occurred at but one station.

The average precipitation for the State was slightly below normal; however, the northeastern panhandle division, the central part of the southern division, and the extreme northwestern part of the State had plus departures. The north-central portion of the State and a few scattered localities in the southern section had deficiencies averaging about one inch.

The average snowfall of 15.5 inches was 9.4 inches above the normal and was the fourth greatest monthly total for any March of record. The greatest number of snow-lying days was 19 at Spruce Knob. One of the heaviest snows of the winter occurred on the 2–3d, blanketing the State with from about four inches along the southwestern border to twenty-four inches in the mountains of Randolph county. The snow was wet and sticky, causing power and telephone lines to break. The four main transmission lines of the Appalachian Power Company, two from the east and two from the west, snapped and caused a total blackout in the Great Kanawha valley for a distance of about twenty miles around Charleston. Power was off for 12 hours during the night of the 2d and the morning of the 3d. Schools were closed and highway traffic suspended until roads could be cleared, the State using 300 snow plows and 200 power graders before the task was accomplished. In four or five days in most cases the snow was practically all gone due to warmer weather.

Winter grains and grasses advanced normally and the end of the month saw ground preparation for Spring crops well under way though handicapped by shortage of farm labor and in some localities by wet ground. Early garden and truck crops were being planted while plum, cherry, and peach buds were beginning to swell at the close.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 71 stations, was 44.1°, or 1.7° above the normal. The mean for the northeastern panhandle division was 42.6°; for the northern division, 43.8°; and for the southern division, 44.8°. The highest monthly mean was 49.8° at Huntington and the lowest, 35.2° at Bayard. The highest temperature was 89° at Madison on the 16th; and the lowest, 0° at Bayard on the 2d.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 122 stations, was 3.64 inches, or 0.25 inch below the normal. In the northeastern panhandle division the average was 3.49 inches; in the northern division, 3.51 inches; and in the southern division, 3.87 inches. The greatest monthly precipitation was 7.63 inches at Pickens, and the least, 1.66 inches at Harrison County Airport. The greatest amount in any 24 consecutive hours was 2.42 inches at Wellsburg on the 3d. The average monthly snowfall was 15.5 inches, or 9.4 inches above the normal. The greatest monthly snowfall was 43.2 inches at Pickens. The average number of days with .01 inch or more of precipitation was 12.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ᵃ one day, ᵇ two days etc. § Also on other dates.

Daily Precipitation for March 1942

VOL. L PARKERSBURG, W. VA., APRIL 1942 No. 4

GENERAL SUMMARY

April was warm, with temperatures above normal at all stations. It was the third driest April of record, while in the southern division, it was the second driest. A very large portion of the rainfall fell during the period 8–11th, mostly as showers, during which the rivers rose rapidly but flood stages were not reached. By the 20th, conditions had become rather droughty, with low relative humidities, and then a period of high temperatures set in during the last week which brought about a lowering of the moisture content of the forest fuels to such an extent that the forest fire hazard became critical. Very serious fires occurred in Logan, Mingo and McDowell Counties, and numerous small fires broke out in other parts of the forested areas, continuing at the close of the month. Snowfall was light. The measurable amounts fell mostly in the north-central and in mountain sections of the northern part of the State. The greatest monthly amount was 8.2 inches at Pickens. The greatest number of snow-lying days was 7 at Spruce Knob.

It was a good month for outdoor activities but too dry for normal germination of crops. Fruit trees bloomed heavily during the month. The frosts that occurred did but little damage.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 72 stations, was 54.7°, or 2.9° above the normal. The mean for the northeastern panhandle division was 54.3°; for the northern division, 54.4°; and for the southern division, 55.2°. The highest monthly mean was 59.6° at Huntington and the lowest, 45.6° at Bayard. The highest temperature was 97° at Hinton on the 30th and the lowest, 13° at Bayard on the 15th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 132 stations, was 1.86 inches, or 1.66 inches below normal. In the northeastern panhandle division the average was 1.63 inches; in the northern division, 2.40 inches; and in the southern division, 1.30 inches. The greatest monthly precipitation was 4.27 inches at Rowlesburg, and the least, 0.23 inch at Man and Williamson. The greatest amount in any 24 consecutive hours was 2.11 inches at Wellsburg on the 9th. The average snowfall was 0.5 inch, or 1.2 inches below the normal. The greatest monthly snowfall was 8.2 inches at Pickens. The average number of days with .01 inch or more of precipitation was 7.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ᵃ one day, ᵇ two days etc. § Also on other dates.

Daily Precipitation for April 1942

VOL. L PARKERSBURG, W. VA., MAY 1942 No. 5

GENERAL SUMMARY

During the month of May, mean temperatures averaged above normal at all stations but three. The warm periods were: 1st-4th, 12-15th, 28th-31st. The cold periods were: 5-6th, 11th, 21st-25th. Freezing temperature occurred at a few places in mountain areas on the 6, 10, 11, 12, 17, and 26th.

Precipitation averaged well above normal in all three divisions, while, in the northeastern panhandle division it averaged about two inches above normal. The excess ranged up to 3.59 inches in the northern part of the northeastern panhandle division. A narrow area comprising roughly the central portion of the State from near the northern border to the southern boundary line had deficiencies of from one-half inch to a little over one inch. During the first week of the month, forest fires were causing much damage to the timbered areas. However, the rains of the first decade were sufficient to effectively quench them. On the 2d a bolt of lightning killed two men who had sought shelter from the storm under a tree near Ceredo.

The growth of vegetation was good during the month. Wet soil hindered planting and cultivation in some places during the latter part of the month.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 71 stations, was 63.5°, or 1.8° above the normal. The mean for the northeastern panhandle division was 63.8°; for the northern division, 63.3°; and for the southern division, 63.6°. The highest monthly mean was 67.3° at Huntington and the lowest, 55.7° at Bayard. The highest temperature was 98° at Hinton on the 1st and the lowest, 27° at Terra Alta on the 26th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 128 stations, was 4.61 inches, or 0.66 inches above normal. In the northeastern panhandle division the average was 5.58 inches; in the northern division, 4.42 inches; and in the southern division, 4.39 inches. The greatest monthly precipitation was 8.49 inches at Spruce Knob, and the least, 2.64 inches at Ravenswood. The greatest amount in any 24 consecutive hours was 3.00 inches at Slaty Fork on the 16th. The average number of days with .01 inch or more of precipitation was 11.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ᵃ one day, ᵇ two days etc. § Also on other dates.

Daily Precipitation for May 1942

VOL. L PARKERSBURG, W. VA., JUNE 1942 NO. 6

GENERAL SUMMARY

Temperature and rainfall were above normal. Only two stations reported mean temperatures below normal, both in the northeastern panhandle. The first decade was warm while the period 23d to 27th was quite cool. Relative humidity was high all during the month. Showers were frequent and well distributed, although the amounts showed considerable variation within short distances. The lightest rainfall occurred in the northeastern and the Ohio River Counties, while in the central and the mountain sections excesses of more than three inches were reported from several stations. Much storm damage occurred on the 7th. Two men were killed by lightning in Fayette County; one at Gatewood and the other at Harvey. Three small bridges in the Huntington area were washed away. Gimlet Creek, Cabell County, overflowed, causing many people to flee their homes. Near the Gilmer County town of Tanner, Old Fork and Tanner Creeks became torrents and carried off a house, a store and filling station and ruined bottomland crops. Some damage was also reported from Reedy, Roane County, mainly to electric power service and gardens.

Crop growth was good throughout the month. However, the frequency of the showers was such as to hinder harvesting of hay, barley, and wheat. Outdoor construction work was hindered to a considerable extent by wet weather.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 71 stations, was 71.4°, or 1.7° above the normal. The mean for the northeastern panhandle division was 70.1°; for the northern division, 71.5°; and for the southern division, 71.7°. The highest monthly mean was 77.0° at Huntington and the lowest, 61.6° at Thornwood (Fire-weather Station). The highest temperature was 99° at Valley Chapel on the 11th, and the lowest, 35° at McNeill on the 15th, and Bayard and Seneca State Forest on the 24th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 127 stations, was 5.17 inches, or 0.69 inch above the normal. In the northeastern panhandle division the average was 4.16 inches; in the northern division, 5.38 inches; and in the southern division, 5.32 inches. The greatest monthly precipitation was 9.66 inches at Hackers Creek and the least, 2.19 inches at Ravenswood. The greatest amount in any 24 consecutive hours was 4.60 inches at Hackers Creek on the 7–8th. The average number of days with .01 inch or more of precipitation was 14.

WILLIAM ANKROM

Mr. William Ankrom, for more than thirty years cooperative observer at New Martinsville, W. Va., died June 19, 1942 at the age of 86. His interest in the Climatology of West Virginia was reflected in his accurate observations, and only illness compelled him to relinquish the work in November 1939. Truly a first citizen of his community, his loss is felt by all. The cooperative work continues in the family, as his son, Dr. Z. W. Ankrom, carries it on.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Hackers Creek

Daily Precipitation for June 1942

VOL. L — PARKERSBURG, W. VA., JULY 1942 — NO. 7

GENERAL SUMMARY

July was slightly above normal in temperature with all but nine widely scattered stations showing excesses of from a tenth up to five degrees. The warm periods were 12–20th and 29th–31st. A cool period occurred on the 7–9th. Readings of 100° or more occurred at ten stations. Precipitation averaged slightly below normal, and consisted of frequent moderate to locally heavy showers, except in the northeastern panhandle and parts of Greenbrier and Pocahontas Counties where the lack of moisture hindered the growth of crops at times. A boy was killed by lightning on the 21st at Cameron. Hail was reported from Webster Springs on the 4th and from Spencer on the 6th and only slight damage occurred. On July 9th a heavy rain in Fayette County sent Paint Creek out of its banks causing the destruction of secondary road bridges at Cirtsville. Maynor, and Pax. About a dozen homes were flooded at Pax and much damage was done to field and garden crops. At Huntington, on the 10th, a torrential rain, accompanied by lightning and a high wind, caused considerable damage to utilities, flooded basements and viaducts, tore limbs from trees, toppled a few chimneys and slowed traffic for about three hours. On the same day at Charleston a heavy rain clogged sewers and did some damage, especially to records stored in the basement of the Statehouse. On the afternoon of the 13th a heavy rain caused considerable damage to growing crops, and washed away a number of shocks of wheat and some newly stacked hay, in the Limestone Hill area on the Wirt-Wood County line.

The weather was very favorable to vegetative growth in all but a very few localities. However, in many places it was poor harvest weather as the frequency of the showers caused much difficulty in curing hay, and also in harvesting wheat and oats. Some damage to hay, wheat, and oats was reported from the wetter sections. The close of the month saw pastures green and lush, meadows, corn, and fruit in good condition. It was, however, beginning to get too wet for potatoes and some garden truck such as tomatoes.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 70 stations, was 73.9°, or 0.7° above the normal. The mean for the northeastern panhandle division was 73.6°; for the northern division, 73.3°; and for the southern division, 74.6°. The highest monthly mean was 79.3° at Huntington and the lowest, 65.2° at Bayard. The highest temperature was 103° at Mathias on the 18th and Martinsburg on the 19th, and the lowest, 41° at Brandywine on the 8th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 124 stations, was 4.44 inches, or 0.18 inch below the normal. In the northeastern panhandle division the average was 2.89 inches; in the northern division, 4.68 inches; and in the southern division, 4.91 inches. The greatest monthly precipitation was 8.35 inches at Williamson, and the least, 1.38 inches at Moorefield. The greatest amount in any 24 consecutive hours was 2.76 inches at Kearneysville on the 11th. The average number of days with .01 inch or more of precipitation was 12.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Hackers Creek

Daily Precipitation for July 1942

VOL. L PARKERSBURG, W. VA., AUGUST 1942 No. 8

GENERAL SUMMARY

Although the month averaged slightly below normal in temperature, there was only one really cool period: that of the 24–26th. The remainder of the month was warm and humid, with the 1st–3d and 15–18th being particularly warm.

The month was the second wettest August of record, being exceeded only in 1898. All stations showed plus departures except three. The excesses ranged from somewhat less than an inch in the southwestern part of the State up to 8.75 inches at Parsons. Ten stations reported totals of ten inches or more of rainfall during the month. On the 21st, a bolt of lightning killed a woman while she was feeding her chickens near a tree at her farm home at Winslow, Wayne County. A pier on the Baltimore and Ohio Railroad bridge over the mouth of the Big Sycamore Creek, Clay County, was undermined by high water on the 23d, causing a train wreck in which the engineer, fireman and a brakeman were killed.

It was an excellent month for crop growth but not the best for harvesting. The close of the month saw apples, corn, buckwheat, and the lesser crops in good condition and beginning to mature.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 69 stations, was 71.1°, or 0.7° below the normal. The mean for the northeastern panhandle division was 70.0°; for the northern division, 70.4°; and for the southern division, 72.1°. The highest monthly mean was 76.2° at Huntington and Logan, and the lowest, 62.6° at Bayard. The highest temperature was 100° at Logan on the 2d, and the lowest, 30° at Bayard on the 26th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 126 stations, was 7.22 inches, or 3.08 inches above normal. In the northeastern panhandle division the average was 7.44 inches; in the northern division, 7.24 inches; and in the southern division, 7.08 inches. The greatest monthly precipitation was 15.03 inches at Valley Head and the least, 1.52 inches at New Cumberland. The greatest amount in any 24 consecutive hours was 4.33 inches at Thornwood on the 8th. The average number of days with .01 inch or more of precipitation was 14.

ERRATA

June 1942: Parkersburg, Page 22, number of rainy days, 11; Page 23, amount on 18th, .01; on the 19th, 1.26.

July 1942: Hinton, Page 26, number of rainy days, 14; Kearneysville, mean temperature, 75.2°. Page 27, Hall, amount on the 7th, 0.86; total for the month, 4.73.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ª one day, ᵇ two days etc. § Also on other dates. * Thornwood

Daily Precipitation for August 1942

VOL. L PARKERSBURG, W. VA., SEPTEMBER 1942 No. 9

GENERAL SUMMARY

The noteworthy feature was the unusually cold weather that prevailed during the closing days of the month, when minimum temperature records for September were broken at 29 stations and equalled at 4 stations. Killing frosts were general but practically all crops had matured and had been harvested so the damage was slight and confined chiefly to late corn, tobacco, and tomatoes. The month averaged below normal in temperature. The first two decades of the month were warm while the third decade was considerably below normal in temperature.

Precipitation was considerably above normal and all but a few widely scattered stations showed plus departures. The heaviest amounts fell in the northern part of the northern division. A patient at the Weston State Hospital was killed by lightning on the evening of September 8th.

September was a better month for harvesting than the two preceding ones, due to longer periods of fair weather. The high temperatures of the first three weeks caused the corn and soybean crops to mature rapidly.

During the water year just ended, from October 1, 1941 to September 30, 1942, the precipitation averaged 99 per cent of normal. The precipitation during the growing season just ended averaged 112 per cent of normal. As it was well distributed, the farm crop yields were at or near record proportions. The ground water supply and the stream levels were about normal at the close of the month.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 71 stations, was 65.1°, or 1.3° below the normal. The mean for the northeastern panhandle division was 64.3°; for the northern division, 64.8°; and for the southern division, 65.6°. The highest monthly mean was 70.6° at Point Pleasant and the lowest, 55.1° at Bayard. The highest temperature was 98° at Martinsburg on the 1st and Point Pleasant on the 13th, and the lowest, 15° at Bayard on the 29th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 131 stations, was 3.97 inches, or 1.07 inches above normal. In the northeastern panhandle division the average was 2.99 inches; in the northern division, 4.59 inches; and in the southern division, 3.64 inches. The greatest monthly precipitation was 8.62 inches at Hastings, and the least, 1.43 inches at Wardensville. The greatest amount in any 24 consecutive hours was 2.73 inches at Saint Marys on the 18th. The average number of days with .01 inch or more of precipitation was 11.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates. * Thornwood

Daily Precipitation for September 1942

VOL. L PARKERSBURG, W. VA., OCTOBER 1942 No. 10

GENERAL SUMMARY

The mean temperature for the State averaged 1.1° above the normal with all but a very few widely-scattered stations reporting plus departures. The only cold period was from the 24th to the 29th. On the 27th and 28th hard freezes were experienced at all stations except in the extreme southern part of the State.

The northern and eastern parts of the State were much above normal in precipitation. It was the third wettest October of record for the northeastern panhandle division. The remainder of the State averaged from about normal in the central part to less than fifty percent of normal in the western and southwestern parts. A trace of snowfall was observed at 58 stations on the 26th.

The noteworthy feature of the month was the heavy rain in the northeastern panhandle division (Potomac River Basin) on the 13–16th, when an average of about six inches fell in approximately 72 hours. The greatest amount for the storm was 10.08 inches at Inwood and the least, 2.10 inches at Spruce Knob. These rains quickly brought the rivers above flood stage and caused several hundred families to evacuate their homes at Ridgely and Keyser. Considerable damage was done to dwellings and business places by the silt deposits. Farm crops, such as shocked corn and stacked hay, were washed away. Apple orchards suffered large losses due to the heavy dropping of the fruit during the storms.—*C.L.W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 73 stations, was 55.8°, or 1.1° above the normal. The mean for the northeastern panhandle division was 55.1°; for the northern division, 55.7°; and for the southern division, 56.1°. The highest monthly mean was 61.2° at Huntington and the lowest, 44.6° at Bayard. The highest temperature was 87° at Huntington, Logan, and Winfield Locks on the 3d, and the lowest, 11° at Thornwood (Fire Weather Station) on the 28th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 130 stations, was 4.04 inches, or 1.18 inches above normal. In the northeastern panhandle division the average was 6.93 inches; in the northern division, 3.73 inches; and in the southern division, 3.08 inches. The greatest monthly precipitation was 11.81 inches at Inwood, and the least, 1.02 inches at Hogsett (Dam 26). The greatest amount in any 24 consecutive hours was 4.71 inches at Piedmont on the 15th. A trace of snowfall was reported from 58 stations during the month. The average number of days with .01 inch or more of precipitation was 10.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ^{a} one day, ^{b} two days etc. § Also on other dates.

Daily Precipitation for October 1942

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

VOL. L PARKERSBURG, W. VA., NOVEMBER 1942 No. 11

GENERAL SUMMARY

Temperatures averaged well above normal with only a few widely scattered stations reporting minus departures. No extremely warm or cold periods were reported The cold periods were the 4–5th, 14–15th, and 27–29th. The warm periods were the 1st–3d, 8–10th, and 16th–21st. No zero temperatures were recorded.

Precipitation was considerably in excess of normal for the State. It was nearly normal in amount for the northeastern panhandle division, but was much in excess in the northern and southern divisions. Minus departures of small amounts were rather numerous in the northeastern panhandle division and at a few widely scattered stations elsewhere. The percentages of normal by divisions were: 97 in the northeastern panhandle division; 151 in the northern division; 136 in the southern division; and for the State 139. The rainfall was well distributed throughout the month, both as to amounts and as to days. Measureable snow fell at a few stations on the 3d, 25th, and 29th. No damage from storm or flood during the month was reported.

Sunshine was considerably below normal with the skies overcast much of the time. Winter grains and pastures remain in good condition, although snow cover was lacking. Corn husking and the gathering of soybeans have been practically completed. Farm work was on a winter routine basis by the close of the month.

TEMPERATURE

The average monthly temperature for the State, based on the records of 69 stations, was 44.7°, or 1.5° above the normal. The mean for the northeastern panhandle division was 44.6°; for the northern division, 44.2°; and for the southern division, 45.3°. The highest monthly mean was 50.2° at Huntington and the lowest, 37.2° at Terra Alta. The highest temperature was 80° at Huntington and Logan on the 20th and the lowest, 9° at Grafton and Pickens on the 28th.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 126 stations, was 3.81 inches, or 1.06 inches above the normal. In the northeastern panhandle division the average was 2.12 inches; in the northern division, 4.49 inches; and in the southern division, 3.65 inches. The greatest monthly precipitation was 6.95 inches at Creston, and the the least, 1.56 inches at Lost River State Park and Petersburg. The greatest amount in any 24 consecutive hours was 1.80 inches at Creston on the 1st. The average monthly snowfall was 0.2 inch, or 2.2 inches below the normal. The greatest monthly snowfall was 5.0 inches at Alpena. The average number of days with .01 inch or more of precipitation was 12.

JULIUS K. MONROE

Mr. Julius K. Monroe, cooperative observer at Lewisburg since October 1, 1936, died October 31, 1942. Mr. Monroe was born at Evansville, West Virginia, August 11, 1864.

For many years he was on the engineering staff of the State Road Commission. In the late nineties he served as cooperative observer at Kingwood, West Virginia, for a period of about two years. His records were neat and accurate and represented his deep interest in the work. His going is sincerely regretted by the Weather Bureau.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ᵃ one day, ᵇ two days etc. § Also on other dates.

Daily Precipitation for November 1942

VOL. L PARKERSBURG, W. VA., DECEMBER 1942 No. 12

GENERAL SUMMARY

The month was cold and wet. It was the ninth coldest December of record and the coldest since 1935. The minimum temperature for the State, —21°, was the lowest December reading since 1917. With the exception of a very few days, abnormally cold weather prevailed from the 1st to the 22d, while the period 26–30th was unusually mild.

The precipitation for the State averaged 164% of normal, and it was the fourth greatest December total of record and the greatest since 1923. Snowfall was well above the average, with the monthly total the third greatest of record for December. The greatest number of snow-lying days was 29 at Spruce Knob. Heavy rains occurred during the last four days of the month and brought a rapid rise in the Ohio River and its tributaries. The tributaries were at or near flood stage on the 30th and 31st, and the Ohio River was well above flood stage on the 31st, but had reached its crest at Wheeling. Despite thorough preparation which minimized losses, the damage to highways and bridges and to stacked crops was considerable. Employees of industrial plants lost much working time either by the flooding of the plants or by their inability to reach their places of employment because of flooded highways.

Although the growing areas lacked a snow cover during most of the month, there was an ample snow cover during the extremely cold weather. Pastures and winter grains were in good condition at the close of the month. Farm work was impeded by the labor shortage and wet ground.—*C. L. W.*

TEMPERATURE

The average monthly temperature for the State, based on the records of 68 stations, was 31.6°, or 3.2° below the normal. The mean for the northeastern panhandle division was 29.8°; for the northern division, 31.1°; and for the southern division, 32.8°. The highest monthly mean was 36.8° at Coalwood (Fire-Weather Station) and Williamson, and the lowest, 23.6° at Bayard. The highest temperature was 75° at Coalwood (Fire-Weather Station) on the 26th, and the lowest, —21° at McNeill and Seneca State Forest on the 21st.

PRECIPITATION

The average monthly precipitation for the State, based on the records of 123 stations, was 5.42 inches, or 2.12 inches above normal. In the northeastern panhandle division the average was 3.58 inches; in the northern division, 5.80 inches; and in the southern division, 5.76 inches. The greatest monthly precipitation was 8.00 inches at Branchland, and the least, 1.70 inches at Petersburg. The greatest amount in any 24 consecutive hours was 3.30 inches at Branchland on the 30th. The average monthly snowfall was 13.2 inches, or 7.0 inches above the normal. The greatest monthly snowfall was 56.5 inches at Alpena. The average number of days with .01 inch or more of precipitation was 15.

The departures from the normal temperature are computed from averages of the entire period for stations having 10 or more years of record. Departures of precipitation with 15 years or more of record are computed from a normal or *standard mean*, adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. Reference letters indicate number of days missing; for example, ᵃ one day, ᵇ two days etc. § Also on other dates.

Daily Precipitation for December 1942

40 WEST VIRGINIA SECTION

S. S. SCHWORM

Vol. L PARKERSBURG, W. VA., YEAR 1942 No. 13

GENERAL SUMMARY

The year averaged exactly normal as to temperature. Five months, January, February, August, September, and December, were below normal, while the remaining months were above normal.

The mean annual precipitation, 48.42 inches, was 5.36 inches above the normal and was the seventh greatest of record. It was the largest annual average since 1937. The first four months were dry, having only 69 percent of the normal precipitation. With the exception of a small minus departure in July, the remaining months were well above normal in precipitation. August and December were particularly wet. The Potomac River was in flood October 14-17th, causing much damage to homes and crops. The Ohio River was in flood and still rising at the close of the year. Considerable damage was done, particularly to field-stored crops. Heavy snows on March 2-3d caused considerable damage to power and telephone lines around Charleston. Except for the period January 10-18th, the navigation on the Ohio was unimpeded by ice during the calendar year.

March and April were good ground preparation and seeding months, with the season advancing normally until the last decade in April when droughty conditions set in with their accompanying forest fire hazards. Very serious fires broke out in Logan, Mingo and McDowell Counties, and numerous smaller fires started in other parts of the forested areas. The rains of the first decade in May effectively quenched these fires. The frequency of the rainy days during the harvest season was such as to greatly hinder the curing of hay and grain crops. However, the abundance of moisture during the growing season was a main factor in producing the record and near record yields of grain and forage crops secured during the past crop year.
